TRANSLATION OF TINYJ SOURCE CODE
INTO
TINYJ VIRTUAL MACHINE INSTRUCTIONS

Each link below takes you to pages that illustrate the execution of the corresponding TinyJ VM instruction:

ADDTOPTR
AND (OR is analogous)
CHANGESIGN
DISCARDVALUE
HEAPALLOC
JUMP
JUMPONFALSE
LE (example of a relational operator)
LOADFROMADDR
NOT
PUSHLOCADDR
PUSHNUM
PUSHSTATADDR
READINT
SAVETOADDR
SUB (example of a binary arithmetic operator)
WRITEINT
WRITESTRING

We first consider the three TinyJ VM instructions listed below.

The effects of executing these instructions are specified on the **Effects of Executing Each TinyJ Virtual Machine Instruction** pages of:
https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf

- PUSHNUM *n*
- PUSHSTATADDR *a*
- SAVETOADDR

Example

What TinyJ VM code would the TinyJ compiler generate for the statement `static int x, y = 10;` in the program on p. 7 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

Solution

Example

What TinyJ VM code would the TinyJ compiler generate for the statement `static int x, y = 10;` in the program on p. 7 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

Solution

We use the static memory allocation rule on p. 3 and Code Generation Rules 1 and 2 on p. 9 of:
https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf

```
x is allocated …
y is allocated …
```

Example

What TinyJ VM code would the TinyJ compiler generate for the statement `static int x, y = 10;` in the program on p. 7 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

Solution

We use the static memory allocation rule on p. 3 and Code Generation Rules 1 and 2 on p. 9 of:
https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf

x is allocated data memory address **0**.
y is allocated data memory address **1**.

The generated instructions are:

```
0:
1:
2:
```

Example

What TinyJ VM code would the TinyJ compiler generate for the statement `static int x, y = 10;` in the program on p. 7 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

Solution

We use the static memory allocation rule on p. 3 and Code Generation Rules 1 and 2 on p. 9 of:
https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf

x is allocated data memory address **0**.
y is allocated data memory address **1**.

[*Blue* items are on EXPRSTACK *after* execution of each instruction.]

The generated instructions are:

```
0: PUSHSTATADDR 1     Pushes pointer to y.
1:
2:
```

Example

What TinyJ VM code would the TinyJ compiler generate for the statement `static int x, y = 10;` in the program on p. 7 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

Solution

We use the static memory allocation rule on p. 3 and Code Generation Rules 1 and 2 on p. 9 of:
https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf

x is allocated data memory address **0**.
y is allocated data memory address **1**.

[*Blue* items are on EXPRSTACK *after* execution of each instruction.]

The generated instructions are:

```
0: PUSHSTATADDR 1      Pushes pointer to y.
1: PUSHNUM 10          Pushes 10.
2:
```

Example

What TinyJ VM code would the TinyJ compiler generate for the statement `static int x, y = 10;` in the program on p. 7 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

Solution

We use the static memory allocation rule on p. 3 and Code Generation Rules 1 and 2 on p. 9 of:
https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf

x is allocated data memory address **0**.
y is allocated data memory address **1**.

[*Blue* items are on EXPRSTACK *after* execution of each instruction.]

The generated instructions are:

```
   0: PUSHSTATADDR 1      Pushes pointer to y.
   1: PUSHNUM 10          Pushes 10.
   2: SAVETOADDR          Pops 10.
                          Pops ptr to y.
                          Stores 10 into y's location.
```

Example

What is the 1st VM instruction generated by the TinyJ compiler for each of the methods main, f, and g in the program on p. 7 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

Solution

Example

What is the 1st VM instruction generated by the TinyJ compiler for each of the methods main, f, and g in the program on p. 7 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

Solution

From Code Generation Rule 4, the instruction is:

INITSTKFRM <no. of stackframe locations given to local vars declared in the method's body>

-
-
-

Example

What is the 1st VM instruction generated by the TinyJ compiler for each of the methods main, f, and g in the program on p. 7 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

Solution

From Code Generation Rule 4, the instruction is:

INITSTKFRM <no. of stackframe locations given to local vars declared in the method's body>

- main's stackframe has **no locations for local vars** declared in main's body--there are **no such vars *in this example***!
-
-

Example

What is the 1st VM instruction generated by the TinyJ compiler for each of the methods main, f, and g in the program on p. 7 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

Solution

From Code Generation Rule 4, the instruction is:

INITSTKFRM <no. of stackframe locations given to local vars declared in the method's body>

- main's stackframe has **no locations for local vars** declared in main's body--there are **no such vars *in this example***!

From the stack-dynamic memory allocation rules on p. 3 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf:

- The 3 local variables declared in f's body are given **3 different locations** in each stackframe of f.
- The only local variable declared in g's body is given **1 location** in each stackframe of g.

Hence

Example

What is the 1st VM instruction generated by the TinyJ compiler for each of the methods main, f, and g in the program on p. 7 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

Solution

From Code Generation Rule 4, the instruction is:

INITSTKFRM <no. of stackframe locations given to local vars declared in the method's body>

- main's stackframe has **no locations for local vars** declared in main's body--there are **no such vars *in this example***!

From the stack-dynamic memory allocation rules on p. 3 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf:

- The 3 local variables declared in f's body are given **3 different locations** in each stackframe of f.
- The only local variable declared in g's body is given **1 location** in each stackframe of g.

Hence main's code begins with:
f's code begins with:
g's code begins with:

Example

What is the 1st VM instruction generated by the TinyJ compiler for each of the methods main, f, and g in the program on p. 7 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

Solution

From Code Generation Rule 4, the instruction is:

INITSTKFRM <no. of stackframe locations given to local vars declared in the method's body>

- main's stackframe has **no locations for local vars** declared in main's body--there are **no such vars *in this example***!

From the stack-dynamic memory allocation rules on p. 3 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf:

- The 3 local variables declared in f's body are given **3 different locations** in each stackframe of f.
- The only local variable declared in g's body is given **1 location** in each stackframe of g.

Hence main's code begins with: 3 **INITSTKFRM 0**
f's code begins with: ? **INITSTKFRM 3**
g's code begins with: ? **INITSTKFRM 1**

Example

What is the 1st VM instruction generated by the TinyJ compiler for each of the methods main, f, and g in the program on p. 7 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

Solution

From Code Generation Rule 4, the instruction is:

INITSTKFRM <no. of stackframe locations given to local vars declared in the method's body>

- main's stackframe has **no locations for local vars** declared in main's body--there are no such vars ***in this example***!

From the stack-dynamic memory allocation rules on p. 3 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf:

- The 3 local variables declared in f's body are given 3 different locations in each stackframe of f.
- The only local variable declared in g's body is given 1 location in each stackframe of g.

Hence main's code begins with: 3 **INITSTKFRM 0**
f's code begins with: ? **INITSTKFRM 3**
g's code begins with: ? **INITSTKFRM 1**

Code memory address is ***not known*** until main and f have been translated.

Code memory address is ***not known*** until main has been translated.

Example

What are the ***last*** VM instructions generated by the TinyJ compiler for the methods main and g in the program on p. 7 of

https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

Solution

Example

What are the ***last*** VM instructions generated by the TinyJ compiler for the methods main and g in the program on p. 7 of

https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

Solution

We see from Code Generation Rules 5 and 6 that:

- main's code ends with:
- As g has **2 formal parameters**,
  g's code ends with:

Example

What are the ***last*** VM instructions generated by the TinyJ compiler for the methods main and g in the program on p. 7 of

https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

Solution

We see from Code Generation Rules 5 and 6 that:

- main's code ends with: **STOP**
- As g has 2 formal parameters,
  g's code ends with: **RETURN 2**

Next, we consider the 2 TinyJ VM instructions listed below.

The effects of executing these instructions are specified on the **Effects of Executing Each TinyJ Virtual Machine Instruction** pages of:
https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf

- WRITESTRING *a b*
- READINT

Example

What TinyJ VM code would the TinyJ compiler generate for the 1st two statements of main method in the program on p. 7 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

The two statements are:

```
System.out.print("Enter num: ");
x = input.nextInt();
```

Solution

Example

What TinyJ VM code would the TinyJ compiler generate for the 1st two statements of main method in the program on p. 7 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

The two statements are:

```
System.out.print("Enter num: ");
x = input.nextInt();
```

Solution

The static memory allocation rules on p. 3 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf imply:

- x is allocated …
- y is allocated …
- The 11 characters of "Enter num: " are allocated …

Example

What TinyJ VM code would the TinyJ compiler generate for the 1st two statements of main method in the program on p. 7 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

The two statements are:

```
System.out.print("Enter num: ");
x = input.nextInt();
```

Solution

The static memory allocation rules on p. 3 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf imply:

- x is allocated data memory address **0**.
- y is allocated data memory address **1**.
- The 11 characters of "Enter num: " are allocated …

Example

What TinyJ VM code would the TinyJ compiler generate for the 1st two statements of main method in the program on p. 7 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

The two statements are:

```
System.out.print("Enter num: ");
x = input.nextInt();
```

Solution

The static memory allocation rules on p. 3 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf imply:

- x is allocated data memory address **0**.
- y is allocated data memory address **1**.
- The 11 characters of "Enter num: " are allocated data memory addresses **2, 3, …, 11, 12.**

Example

What TinyJ VM code would the TinyJ compiler generate for the 1st two statements of main method in the program on p. 7 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

The two statements are: **System.out.print("Enter num: ");**
x = input.nextInt();

Solution

The static memory allocation rules on p. 3 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf imply:

- x is allocated data memory address **0**.
- y is allocated data memory address **1**.
- The 11 characters of "Enter num: " are allocated data memory addresses **2, 3, …, 11, 12.**

[*Blue* items are on EXPRSTACK *after* execution of the instruction.]

Hence the generated instructions are:

4:
5:
6:
7:

Example

What TinyJ VM code would the TinyJ compiler generate for the 1st two statements of main method in the program on p. 7 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

The two statements are: **System.out.print("Enter num: ");**
x = input.nextInt();

Solution

The static memory allocation rules on p. 3 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf imply:

- x is allocated data memory address **0**.
- y is allocated data memory address **1**.
- The 11 characters of "Enter num: " are allocated data memory addresses **2, 3, …, 11, 12**.

[*Blue* items are on EXPRSTACK *after* execution of each instruction.]

Hence the generated instructions are:

4: WRITESTRING 2 12 Writes "Enter num: " to the screen.
5:
6:
7:

Example

What TinyJ VM code would the TinyJ compiler generate for the 1st two statements of main method in the program on p. 7 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

The two statements are: **System.out.print("Enter num: ");**
x = input.nextInt();

Solution

The static memory allocation rules on p. 3 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf imply:

- x is allocated data memory address **0**.

- The 11 characters of "Enter num: " are allocated data memory addresses **2, 3, …, 11, 12**.

[*Blue* items are on EXPRSTACK *after* execution of each instruction.]

Hence the generated instructions are:

```
4: WRITESTRING 2 12 Writes  "Enter num: "  to the screen.
5: PUSHSTATADDR 0   Pushes pointer to x.
6: READINT          Reads an int from kbd; pushes its value.
7:
```

Example

What TinyJ VM code would the TinyJ compiler generate for the 1st two statements of main method in the program on p. 7 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

The two statements are: **System.out.print("Enter num: ");**
x = input.nextInt();

Solution

The static memory allocation rules on p. 3 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf imply:

- x is allocated data memory address **0**.
- y is allocated data memory address **1**.
- The 11 characters of "Enter num: " are allocated data memory addresses **2, 3, …, 11, 12**.

[*Blue* items are on EXPRSTACK *after* execution of each instruction.]

Hence the generated instructions are:

```
4: WRITESTRING 2 12   Writes  "Enter num: "  to the screen.
5: PUSHSTATADDR 0     Pushes pointer to x.
6: READINT            Reads an int from kbd; pushes its value.
7: SAVETOADDR         Pops the int; pops the pointer to x;
                      stores the int into x's location.
```

Next, we consider the TinyJ VM instructions listed below. The effects of executing these instructions are specified on the **Effects of Executing Each TinyJ Virtual Machine Instruction** pages of:

https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf

Next, we consider the TinyJ VM instructions listed below. The effects of executing these instructions are specified on the **Effects of Executing Each TinyJ Virtual Machine Instruction** pages of:
https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf

- PUSHLOCADDR *s*
- LOADFROMADDR
- ADD, SUB, MUL, DIV, MOD
- EQ, NE, LE, GE, LT, GT
- AND, OR
- CHANGESIGN
- NOT

Example

What TinyJ VM code does the TinyJ compiler generate for the method g in the program on p. 7 of

https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

```
static void g (int d, int e)
{
  int z;
  y = d / e;
}
```

Example

What TinyJ VM code does the TinyJ compiler generate for the method g in the program on p. 7 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

```
static void g (int d, int e)
{
  int z;
  y = d / e;
}
```

Solution

The static and stack-dynamic memory allocation rules on p. 3 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf imply:

- y is given …
- z is given …
- e is given …
- d is given …

Example

What TinyJ VM code does the TinyJ compiler generate for the method g in the program on p. 7 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

```
static void g (int d, int e)
{
  int z;
  y = d / e;
}
```

Solution

The static and stack-dynamic memory allocation rules on p. 3 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf imply:

- y is given the data memory address 1.
- z is given …
- e is given …
- d is given …

Example

What TinyJ VM code does the TinyJ compiler generate for the method g in the program on p. 7 of

https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

```
static void g (int d, int e)
{
  int z;
  y = d / e;
}
```

Solution

The static and stack-dynamic memory allocation rules on p. 3 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf imply:

- y is given the data memory address 1.
- z is given the location with offset +1 in a stackframe of g.
- e is given …
- d is given …

Example

What TinyJ VM code does the TinyJ compiler generate for the method g in the program on p. 7 of

https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

```
static void g (int d, int e)
{
  int z;
  y = d / e;
}
```

Solution

The static and stack-dynamic memory allocation rules on p. 3 of https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf imply:

- y is given the data memory address 1.
- z is given the location with offset +1 in a stackframe of g.
- e is given the location with offset -2 in a stackframe of g.
- d is given the location with offset -3 in a stackframe of g.

What TinyJ VM code does the TinyJ compiler generate for the method

```
static void g (int d, int e)
{
  int z;
  y = d / e;
}
```

Solution

The static and stack-dynamic memory allocation rules

imply:

- y is given the data memory address 1.
- z is given the location with offset +1 in a stackframe of g.
- e is given the location with offset -2 in a stackframe of g.
- d is given the location with offset -3 in a stackframe of g.

What TinyJ VM code does the TinyJ compiler generate for this method?

```
static void g (int d, int e)
{
  int z;
  y = d / e;
}
```

Solution

The static and stack-dynamic memory allocation rules imply:

- y is given data memory address 1.
- z is given the location with offset +1 in a stackframe of g.
- e is given the location with offset -2 in a stackframe of g.
- d is given the location with offset -3 in a stackframe of g.

What TinyJ VM code does the TinyJ compiler generate for this method?

```
static void g (int d, int e)
{
  int z;
  y = d / e;
}
```

Solution

The static and stack-dynamic memory allocation rules imply:

- y is given data memory address 1.
- z is given the location with offset +1 in a stackframe of g.
- e is given the location with offset -2 in a stackframe of g.
- d is given the location with offset -3 in a stackframe of g.

Generated Code:

INITSTKFRM 1 **From Code Generation Rule 4.**

RETURN 2 **From Code Generation Rule 6, as g has 2 parameters.**

What TinyJ VM code does the TinyJ compiler generate for this method?

```
static void g (int d, int e)
{
  int z;
  y = d / e;
}
```

Solution

The static and stack-dynamic memory allocation rules imply:

- y is given data memory address 1.
- z is given the location with offset +1 in a stackframe of g.
- e is given the location with offset -2 in a stackframe of g.
- d is given the location with offset -3 in a stackframe of g.

Generated Code: [*Blue* items are on EXPRSTACK *after execution* of each instruction.]

```
INITSTKFRM 1     From Code Generation Rule 4.

PUSHSTATADDR 1 Pushes ptr to y.

RETURN 2         From Code Generation Rule 6, as g has 2 parameters.
```

What TinyJ VM code does the TinyJ compiler generate for this method?

```
static void g (int d, int e)
{
  int z;
  y = d / e;
}
```

Solution

The static and stack-dynamic memory allocation rules imply:

- y is given data memory address 1.
- z is given the location with offset +1 in a stackframe of g.
- e is given the location with offset -2 in a stackframe of g.
- d is given the location with offset -3 in a stackframe of g.

Generated Code: [*Blue* items are on EXPRSTACK *after execution* of each instruction.]

```
INITSTKFRM 1    From Code Generation Rule 4.

PUSHSTATADDR 1 Pushes ptr to y.
PUSHLOCADDR -3 Pushes ptr to d.

RETURN 2        From Code Generation Rule 6, as g has 2 parameters.
```

What TinyJ VM code does the TinyJ compiler generate for this method?

```
static void g (int d, int e)
{
  int z;
  y = d / e;
}
```

Solution

The static and stack-dynamic memory allocation rules imply:

- y is given data memory address 1.
- z is given the location with offset +1 in a stackframe of g.
- e is given the location with offset -2 in a stackframe of g.
- d is given the location with offset -3 in a stackframe of g.

Generated Code: [*Blue* items are on EXPRSTACK *after execution* of each instruction.]

```
INITSTKFRM 1     From Code Generation Rule 4.

PUSHSTATADDR 1   Pushes ptr to y.
PUSHLOCADDR -3   Pushes ptr to d.
LOADFROMADDR     Replaces ptr to d with d's value on top of stack.

RETURN 2         From Code Generation Rule 6, as g has 2 parameters.
```

What TinyJ VM code does the TinyJ compiler generate for this method?

```
static void g (int d, int e)
{
  int z;
  y = d / e;
}
```

Solution

The static and stack-dynamic memory allocation rules imply:

- y is given data memory address 1.
- z is given the location with offset +1 in a stackframe of g.
- e is given the location with offset -2 in a stackframe of g.
- d is given the location with offset -3 in a stackframe of g.

Generated Code: [*Blue* items are on EXPRSTACK *after execution* of each instruction.]

```
INITSTKFRM 1    From Code Generation Rule 4.

PUSHSTATADDR 1 Pushes ptr to y.
PUSHLOCADDR -3 Pushes ptr to d.
LOADFROMADDR   Replaces ptr to d with d's value on top of stack.
PUSHLOCADDR -2 Pushes ptr to e.
```

```
RETURN 2        From Code Generation Rule 6, as g has 2 parameters.
```

What TinyJ VM code does the TinyJ compiler generate for this method?

```
static void g (int d, int e)
{
  int z;
  y = d / e;
}
```

Solution

The static and stack-dynamic memory allocation rules imply:

- y is given data memory address 1.
- z is given the location with offset +1 in a stackframe of g.
- e is given the location with offset -2 in a stackframe of g.
- d is given the location with offset -3 in a stackframe of g.

Generated Code: [*Blue* items are on EXPRSTACK *after execution* of each instruction.]

```
INITSTKFRM 1    From Code Generation Rule 4.

PUSHSTATADDR 1  Pushes ptr to y.
PUSHLOCADDR -3  Pushes ptr to d.
LOADFROMADDR    Replaces ptr to d with d's value on top of stack.
PUSHLOCADDR -2  Pushes ptr to e.
LOADFROMADDR    Replaces ptr to e with e's value on top of stack.

RETURN 2        From Code Generation Rule 6, as g has 2 parameters.
```

What TinyJ VM code does the TinyJ compiler generate for this method?

```
static void g (int d, int e)
{
  int z;
  y = d / e;
}
```

Solution

The static and stack-dynamic memory allocation rules imply:

- y is given data memory address 1.
- z is given the location with offset +1 in a stackframe of g.
- e is given the location with offset -2 in a stackframe of g.
- d is given the location with offset -3 in a stackframe of g.

Generated Code: [*Blue* items are on EXPRSTACK *after execution* of each instruction.]

```
INITSTKFRM 1     From Code Generation Rule 4.

PUSHSTATADDR 1   Pushes ptr to y.
PUSHLOCADDR -3   Pushes ptr to d.
LOADFROMADDR     Replaces ptr to d with d's value on top of stack.
PUSHLOCADDR -2   Pushes ptr to e.
LOADFROMADDR     Replaces ptr to e with e's value on top of stack.
DIV              Pops e's value; pops d's value; pushes (d/e)'s value.

RETURN 2         From Code Generation Rule 6, as g has 2 parameters.
```

What TinyJ VM code does the TinyJ compiler generate for this method?

```
static void g (int d, int e)
{
  int z;
  y = d / e;
}
```

Solution

The static and stack-dynamic memory allocation rules imply:

- y is given data memory address 1.
- z is given the location with offset +1 in a stackframe of g.
- e is given the location with offset -2 in a stackframe of g.
- d is given the location with offset -3 in a stackframe of g.

CALLSTATMETHOD 34
ADD               Pops value returned by f(21,22,23); pops y's value;
                  pushes (y+f(21,22,23))'s value.
```

SEE EARLIER SLIDE.

Execution of method f puts the value returned by f(21,22,23) on top of stack.

What TinyJ VM code does the TinyJ compiler generate for the statement `System.out.println(y + f(21,22,23));` in `main` in the program on p. 7 of

https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf ?

Solution

Recall that y is given the data memory address 1.

Generated Code:

```
PUSHSTATADDR 1    Pushes ptr to y.
LOADFROMADDR      Replaces ptr to y with y's value on top of stack.
PUSHNUM 21
